

Figure 9.2 Increase in the average minimum and maximum temperatures of each calendar month, from 1960 to 2016, at Rekomitjie Research Station in Zimbabwe. Data from linear regression where the dependent variable was either the mean maximum or mean minimum, in the pertinent month of each year, and the independent variable was the year since 1960. The increases in the minima are significant ($P < 0.05$) for all months except April. For the maxima the increases are significant only for August, September and November.
